Irrigation water N lookup tables

Instructions on use of these lookup tables

Once printed, these lookup tables can be used to calculate the N added to a field in irrigation water. **No computer is needed to use the lookup tables.**

For more information, or to use an online calculator to obtain a similar estimate of the amount of nitrogen (N) in a single or blended water source, please go to https://agmpep.com/calc-irrn/ . That calculator also contains a convertor from water volume or pump run time to water depth (inches). A simple version of this convertor is on the "Acre-feet_or_run_time_to_inches" tab in this workbook, but unlike these lookup tables, it must be used on a computer.

Most surface irrigation water supplies will have very low N concentrations. Groundwater may have more, and some groundwater can have very high concentrations. In these cases, ignoring the N contribution of irrigation water when making N management decisions can result in over-application of N to a crop.

Nitrate is usually the main source of irrigation water N. Ammonium will not be relevant for most irrigation water, but can be important if any confined animal or other wastewater is being used. If you don't have a current lab report, you can use other resources to estimate concentrations of nitrate, and (when needed) ammonium:
>>For surface water, obtain concentrations from your irrigation water supplier if they have a recent laboratory result or an estimate of the long-term average.
>>For groundwater, results from past analyses from the same or similar wells can be averaged.

The printed **Tables 1 through 4** can be used to determine the amount of N in irrigation water that you apply, as follows:

If you know your applied water in inches, proceed directly to Table 3 to lookup the amount of nitrate-N (lb/a) it contains. For a detailed explanation of how to use this lookup table, see "**Using Tables 3 and 4**", below.

If you don't know your applied water in terms of acre-feet or inches applied, but do know run time and flow rate, lookup the volume in **Table 1**. Then you can use the acre-feet result to lookup inches of applied water in **Table 2**.

If you don't know your applied water in terms of inches applied but do know it in acre-feet, use it with your field acreage to lookup inches of applied water in **Table 2**.

If you also have some ammonium in your irrigation water (as many wastewaters, for example, do), then lookup the amount of ammonium-N (lb/a) in **Table 4**.

Nitrate and ammonium are dealt with on **Tables 3 and 4**, so you should choose one or the other, depending on the form of N you are evaluating. If you are working with both nitrate and ammonium forms of N, then you will need to use each table separately, and add the results together to get the total inorganic N in your water.

Using Tables 3 and 4
Identify the form of nitrogen on your lab report or other reference, and look up the result (in mg/L = ppm) vertically downward in the column matching the analysis in your report (choosing from among the "***N concentration (mg/L or ppm)***" columns, containing values for Nitrate-N or Nitrate (both on **Table 3**), and Ammonium-N or Ammonium (both on **Table 4**), as applicable. Most irrigation water lab reports will show only nitrate (**Table 3**). Select the horizontal row where the value most closely matches the result on your report. *As with any lookup table, if the exact value for your field is not displayed, select and look up the results for values slightly above and below your field's value, then interpolate to select an intermediate result that applies to your field.* **This interpolation approach is also applicable to Tables 1 and 2.**

Select the column showing the depth of irrigation water from this source that is taken up by your crop during the year, from the row of numbers immediately beneath the green bar labeled "***Depth of Water during Season (inches).***"

At the beige cell where the selected row and column intersect you will find a calculated estimate of N available to the crop from the irrigation source, in pounds of N per acre-year.

If irrigating with more than one irrigation water source (for example, surface & groundwater sources being used in the same field during the same year), repeat the process for each source of water, and add the results together to get the total inorganic N from the multiple water sources. Again, surface irrigation supplies often contain little N, but this should be confirmed.

To account for irrigation water N when fertilizing, subtract the result proportionally from applications made during periods when the source of irrigation water is being used. For example, if a groundwater supply that has higher nitrate concentration is used early in the season, most of the applied N reduction would be made during that period.

Numbers in beige field are in inches of water on the field

Table 1. Skip to Table 3 if you know applied water in acre-feet or inches. Otherwise, use this table to look up applied water in acre-feet based on a) application flow rate (in gallons per minute [gpm] or cubic feet per second [cfs]), and b) pump run time (or application duration, in hours).

Run time or application duration (hours)	Application flow rate (in gpm)	50	60	70	80	90	100	120	140	160	180	200	240	280	320	360	400	480	560	640	720	800	960	1120	1280	1440	1600	1920	2240	2560	2880	3200

Numbers in beige fields are in pounds of N per acre-year

Table 3. Use this table to look up N in lb/a based on a) depth of water applied, and b) nitrate concentration in applied water.

N concentration (mg/L or ppm)		*Depth of Water during Season (inches)*																									
as NO3-N (Nitrate-N)	as NO3 (Nitrate)	10	12	14	16	18	20	22	24	26	28	30	32	34	36	38	40	42	44	46	48	50	52	54	56	58	60

Numbers in beige fields are in pounds of N per acre-year

Table 4. If your water contains some ammonium nitrogen, then use this table to look up N in lb/a based on a) depth of water applied, and b) ammonium concentration in applied water.

N concentration (mg/L or ppm)		*Depth of Water during Season (inches)*
